The objective of this research is to demonstrate the fundamental agreement between economists and sociologists’ theoretical contributions related to the network approach. In order to do so, contributions were grouped into six main categories: teleology, epistemology, methodology, individual agents, organizations, and institutions. Based on the results, it was concluded that, while these contributions have a very similar theoretical profile, it is possible to identify some discrepancies regarding the markets-networks-hierarchies taxonomy.

**Keywords:** Economic theory, sociological theory, network approach, theoretical convergence.

**JEL:** A12, B4, D85, N01, Y80.
